Methods for automatically loading secondary applications in GstarCAD

1. Using “application.ldr” configuration file

1) Find file “application.ldr” in GstarCAD installation directory or Support File Search Path. If the file didn’t exist, you can create it in one of above path.
2) Append the path(s) of your customized GRX file(s) in it.

Note: This method is only for GRX applications but not for NET application.

2. Using LSP

1) Find file “Gstarcad\Support**gcad2017doc.lsp**”, then add code as below:
(load "###.lsp")

2) Create "###.lsp" file in support file search path, then add code as below：
(command "netload" "***.dll")
(command "arx" "l" "***.grx")

Note:

File path of GRX: full path or file name only. When using file name only, the file should be located in Support File Search Path.

File path of .NET: full path or file name only. When using file name only, the file should be located in installation directory.

Format of file path：“C:\\Folder\\your.dll”

3. Using Startup Suite

1) Find or create following key in Registry manually or in your code:

HKEY_CURRENT_USER\SOFTWARE\Gstarsoft\GstarCAD\R17.0\en-WW\Profiles\<<Unnamed Profile>>\Dialogs\Appload\Startup

Note: Corresponding version and profile in the path change with your own products.

2) Configuration under registry key

Name: NumStartup Type: DWORD Value: number of applications in Startup Suite.

Name: #Startup (# stands for number) Type: String Value: path of GRX or DLL file

GstarCAD will get the files from 0Startup to (NumStartUp-1)Startup in registry, then load them automatically.

Note:

The file paths should follow the same rule in Method 2 as well. The only difference is that "\\" could be replaced by "\". For example, "C:\Folder\your.dll".

In addition, LSP files can also be added into Startup Suite and load automatically when Gstarcad start, but it is not recommended because when opening a dwg or creating a new drawing, the LSP files in Startup Suite will be loaded again and again.

4. Using Registry

1) **Find or create the following key in Registry manually or in your code:**
HKEY_CURRENT_USER\SOFTWARE\Gstarsoft\GstarCAD\R17.0\en-WW\Applications

Note:

- Corresponding version and profile in the path change with your own products.
- acrxProductKey() is helpful for getting the registry path:

HKEY_CURRENT_USER\SOFTWARE\Gstarsoft\GstarCAD\R17.0\en-WW\

2) **Find or create a new key "Applications" (pay attention to "s") and create a new item under the key, for example "MyProgram". Under this new item, add keys as below：**

Name: MANAGED Type: DWORD Value: 0 for GRX and 1 for NET
Name: Loader Type: String Value: path of GRX or DLL file

Note:

- This method is only applicable for GRX and NET applications.
- The file paths should follow the same rule in Method 2.

In summary, users can choose their own suitable methods in different situations.
